

Timelapse Nailer Project

Chris Wish List for updates:

- Better / more intuitive UI
- Error handling so you know where in the process it barfs
- If it has an error it should pause instead of keep going.
- Change order of operations - instead of writing to same folder (drive will be full) It should write to destination folder and rewrite it in process (instead of what its doing right now where it outputs the files to the same folder and then moves them and then renames them.
- possible multithreading?

Deadline (Mid week of March 18th) for listed features:

- Change order of operations - instead of writing to same folder (drive will be full) It should write to destination folder and rewrite it in process (instead of what its doing right now where it outputs the files to the same folder and then moves them and then renames them.

Possible Ideas - Include the 'exiv2' library inside the program to prevent needing to install and compile and build external library.
